

*“Conservation means development as much as it does protection. I recognize the right and duty of this generation to develop and use the natural resources of our land; but I do not recognize the right to waste them, or to rob, by wasteful use, the generations that come after us.”* Theodore Roosevelt, 1910

**At Revett**, our environmental philosophy can best be described as “responsible use.” Like Teddy Roosevelt, we believe that with care and planning, we can utilize our natural resources to benefit today’s generation while leaving a valuable natural legacy for the generations that follow.

Copper and silver ore play a vital role in today’s modern world. It is used in computers, telephones, solar energy cells, electrical components, air and water purifiers, aerospace, and medicine. The challenge is to recover the ore in a responsible manner.

How does that work in practice? Before we move a single pebble, we have carefully planned the entire project. Working with regulators and scientists, we know how we will manage the operation to protect neighboring wildlife and habitat, how we will preserve water quality, **how we will restore the landscape when the project** is completed, and how we will monitor it for years afterward to ensure that the environment is protected.

As Theodore Roosevelt said, “In utilizing and conserving the natural resources of the nation, the one characteristic more essential than any other is foresight.”

**We couldn’t have said it better.**
